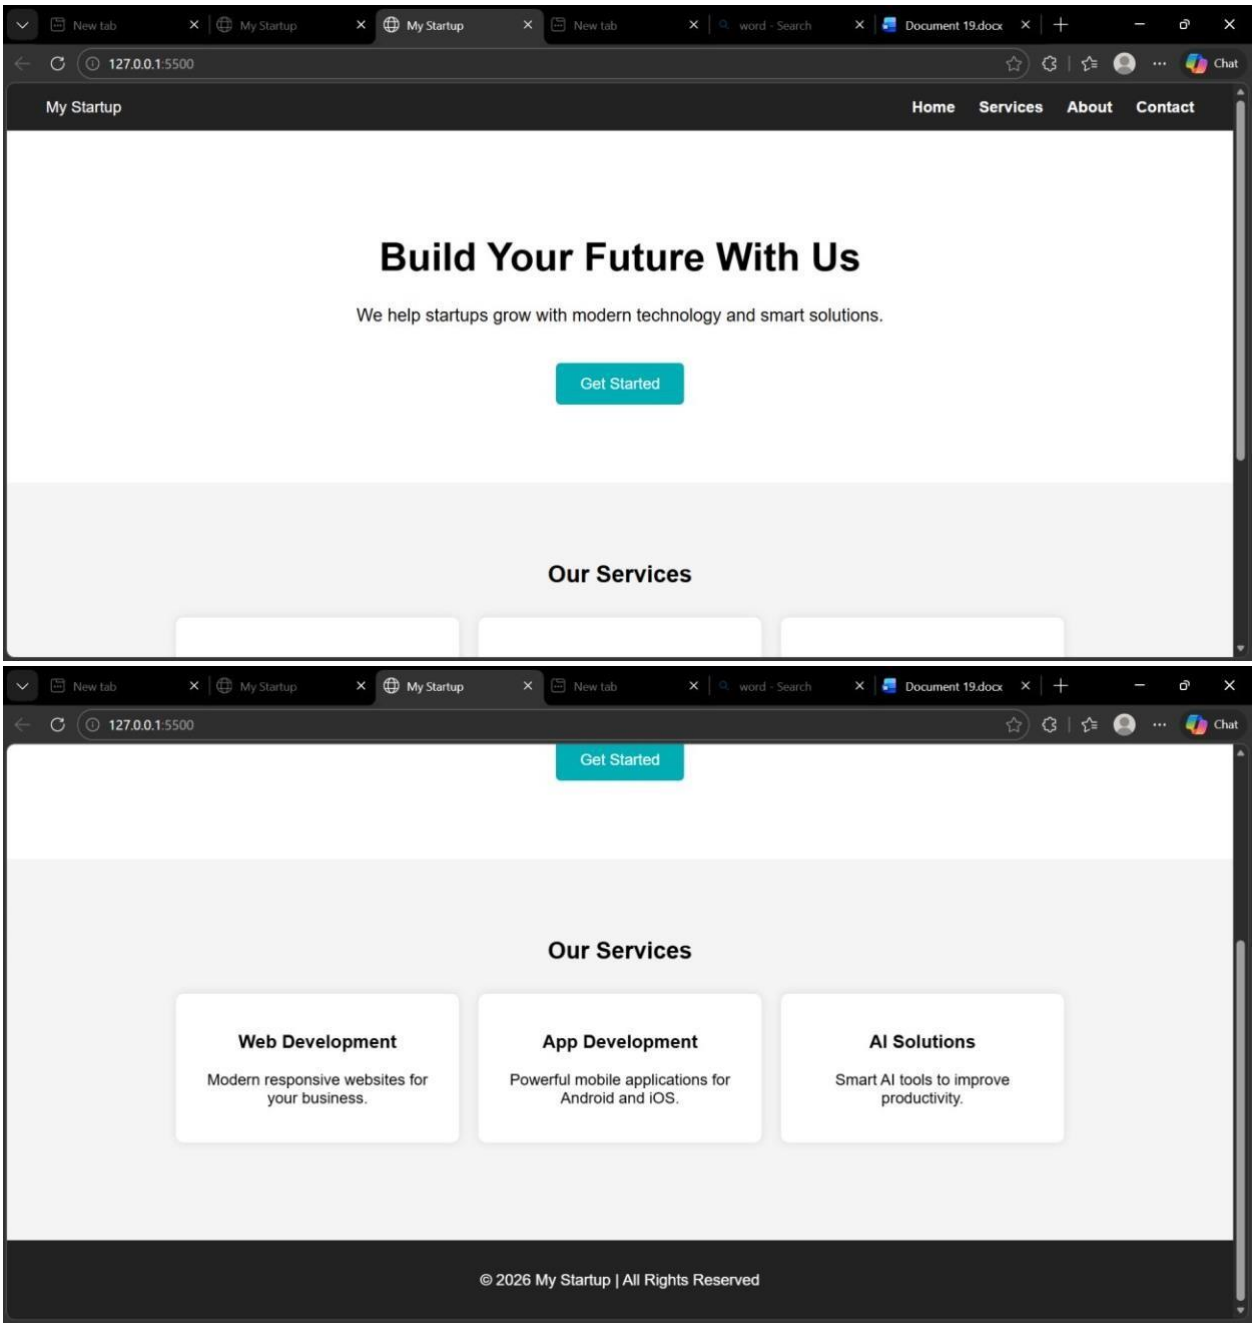
Output:



Explanation:

-->This task creates a responsive homepage using HTML and CSS.

-->The webpage contains a header with navigation links, a hero section, -

>service cards, and a footer. CSS is used for styling and media queries are

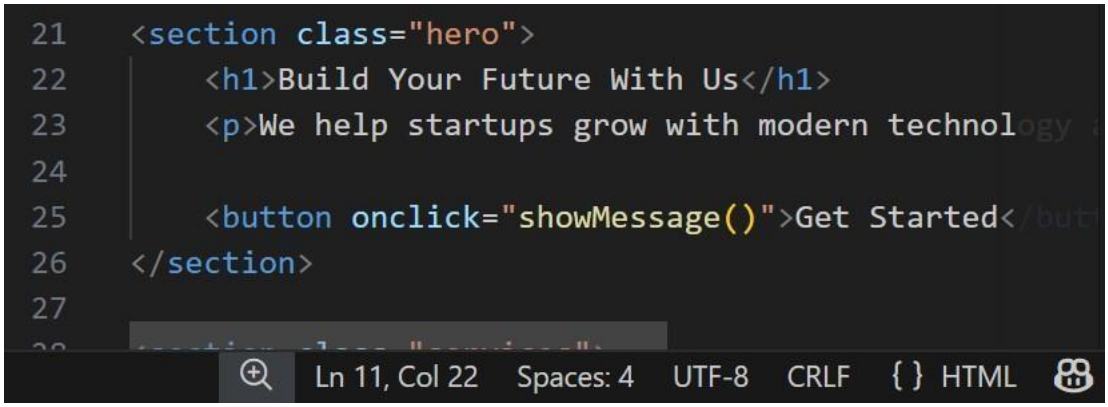
used to make the webpage responsive for different screen sizes.

Task 2: Button Interaction using JavaScript

Prompt: Add a call-to-action button to the webpage.

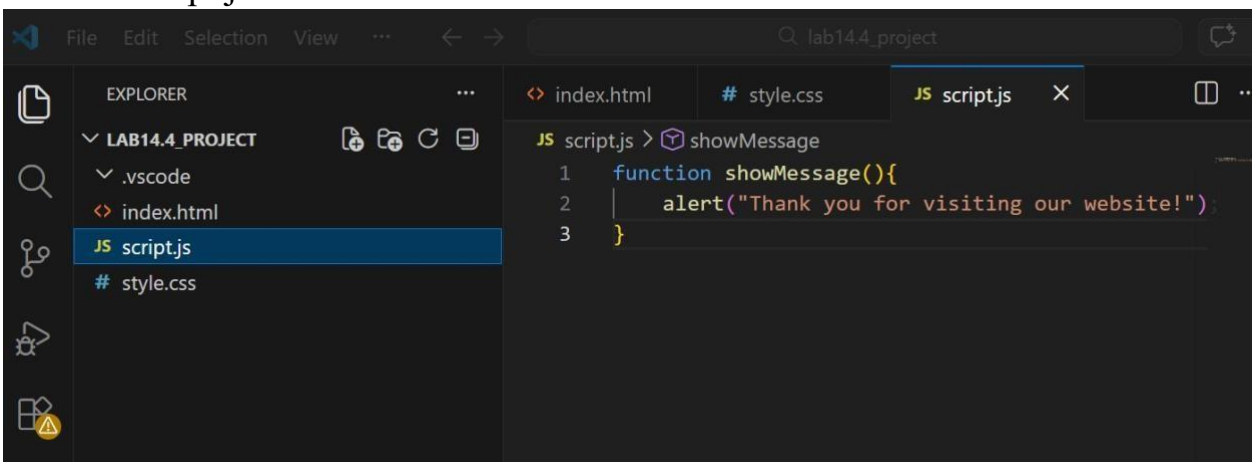
When the user clicks the button, display an alert message using JavaScript without reloading the page.

Codes: index.html – edited part

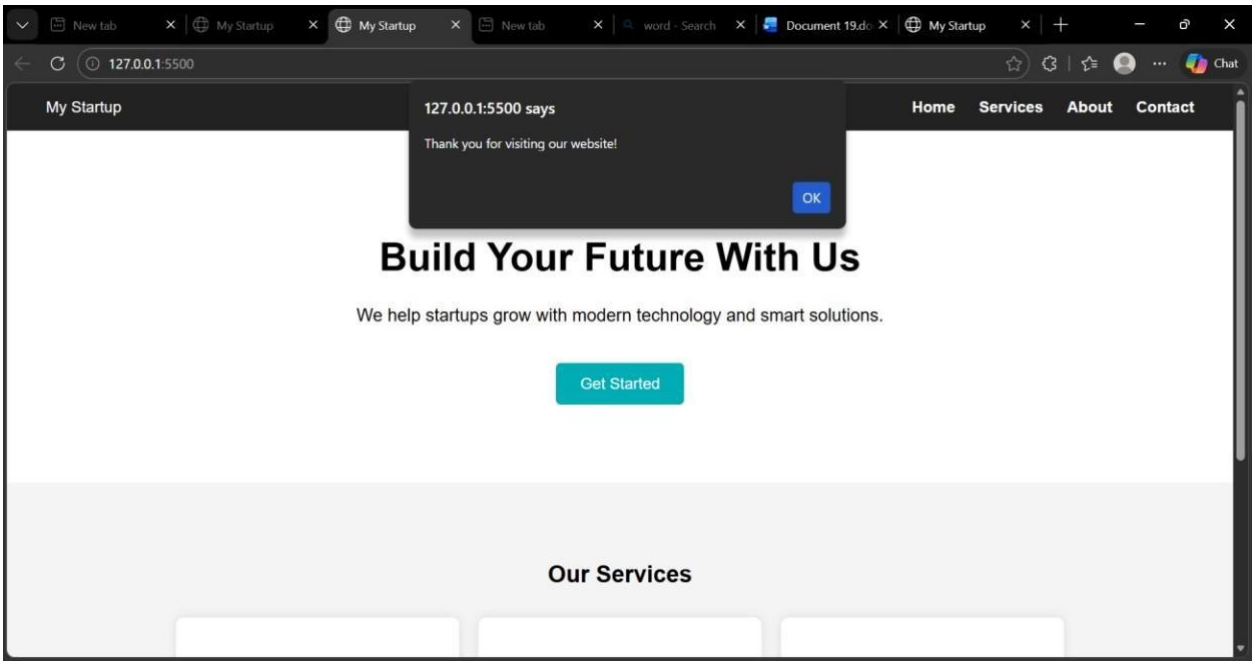


Java Script connection:

Add file :script.js



Output:



Explanation:

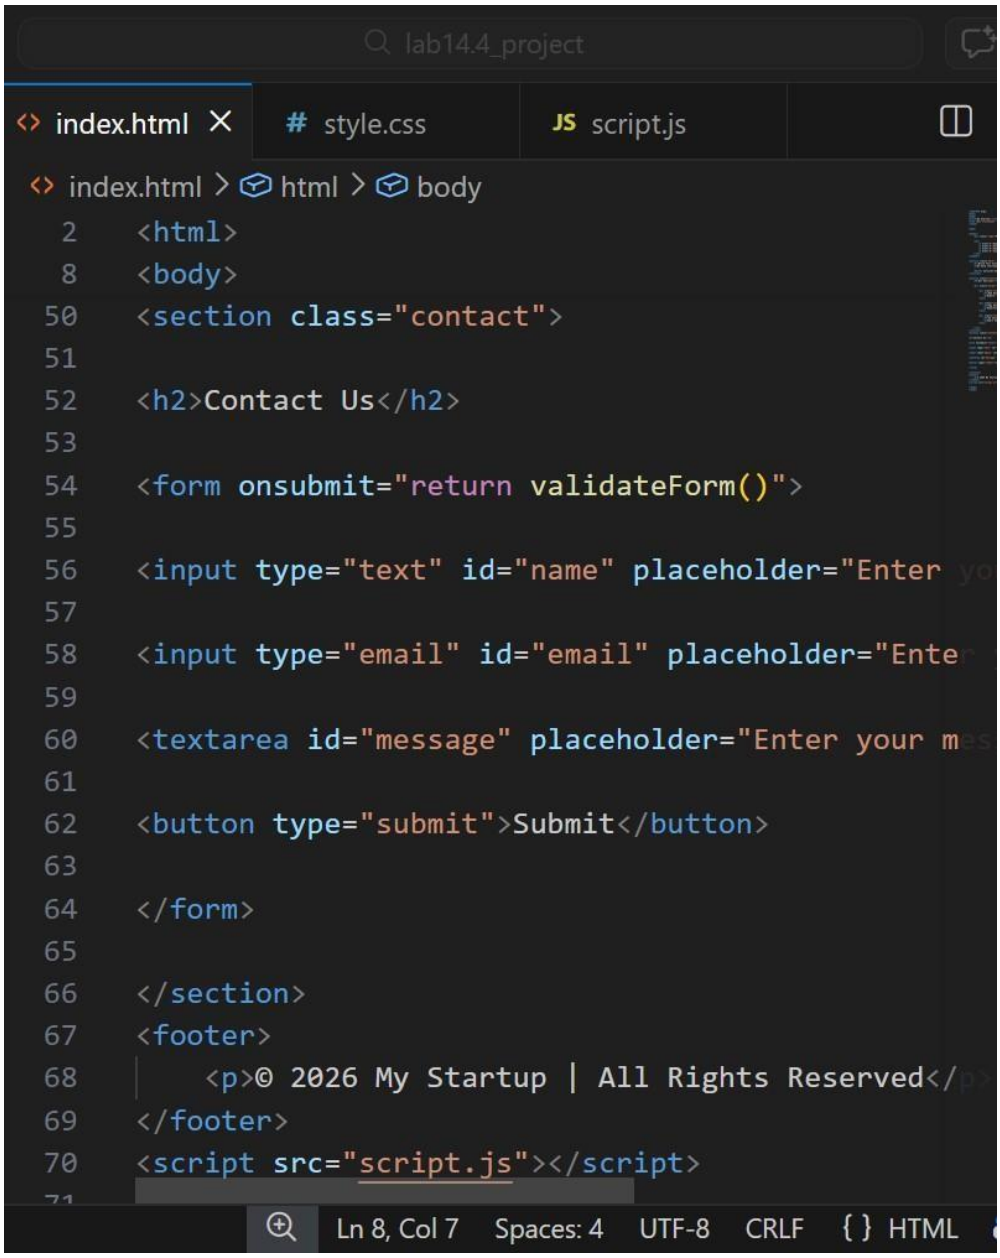
The button interaction is implemented using JavaScript.
When the user clicks the Get Started button, the showMessage() function is triggered and an alert message is displayed on the screen.

Task 3: Contact Form Validation using JavaScript

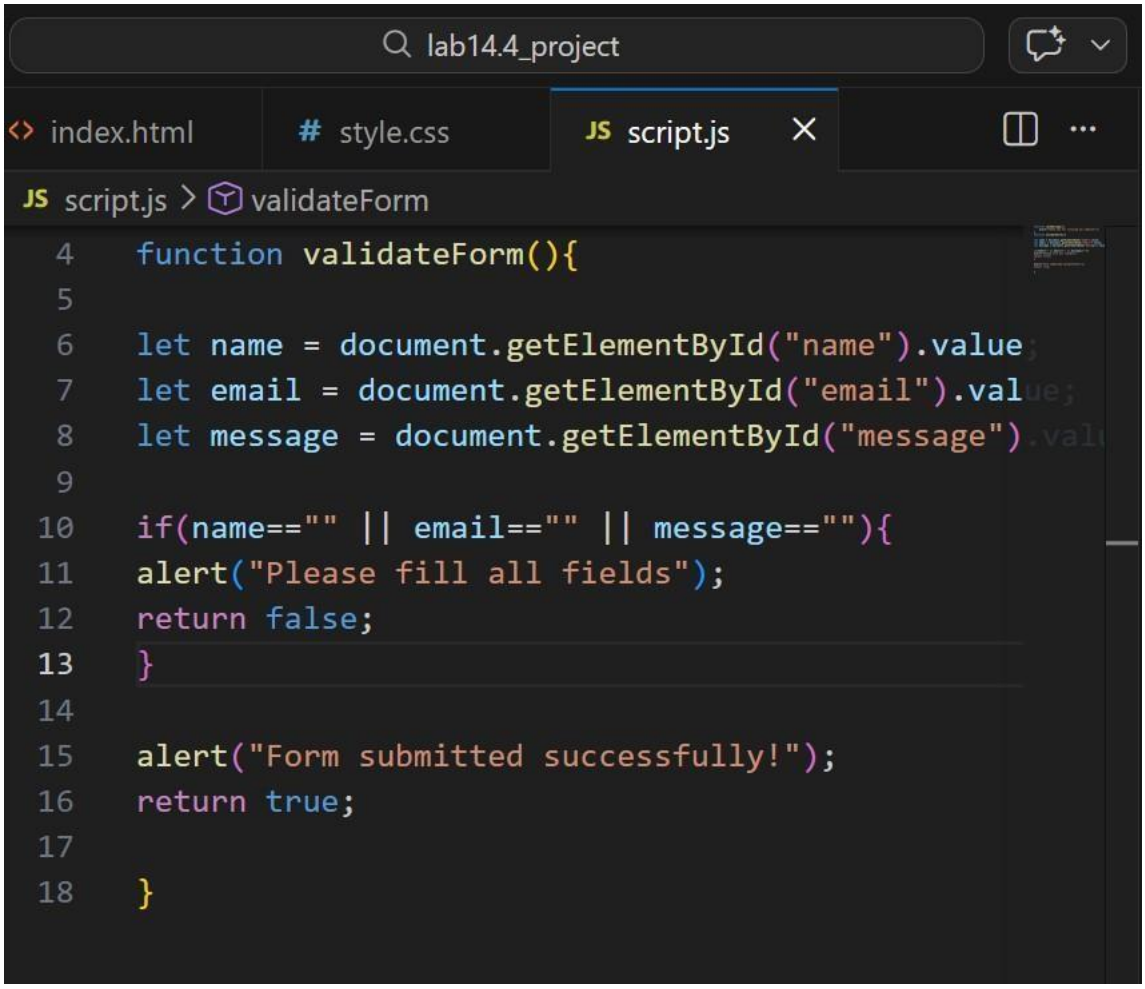
Prompt: Create a contact form using HTML with fields for Name, Email, and Message.

Use JavaScript to validate the form by checking empty fields and verifying the email format before submission.

Codes: index.html – Contact Form Section

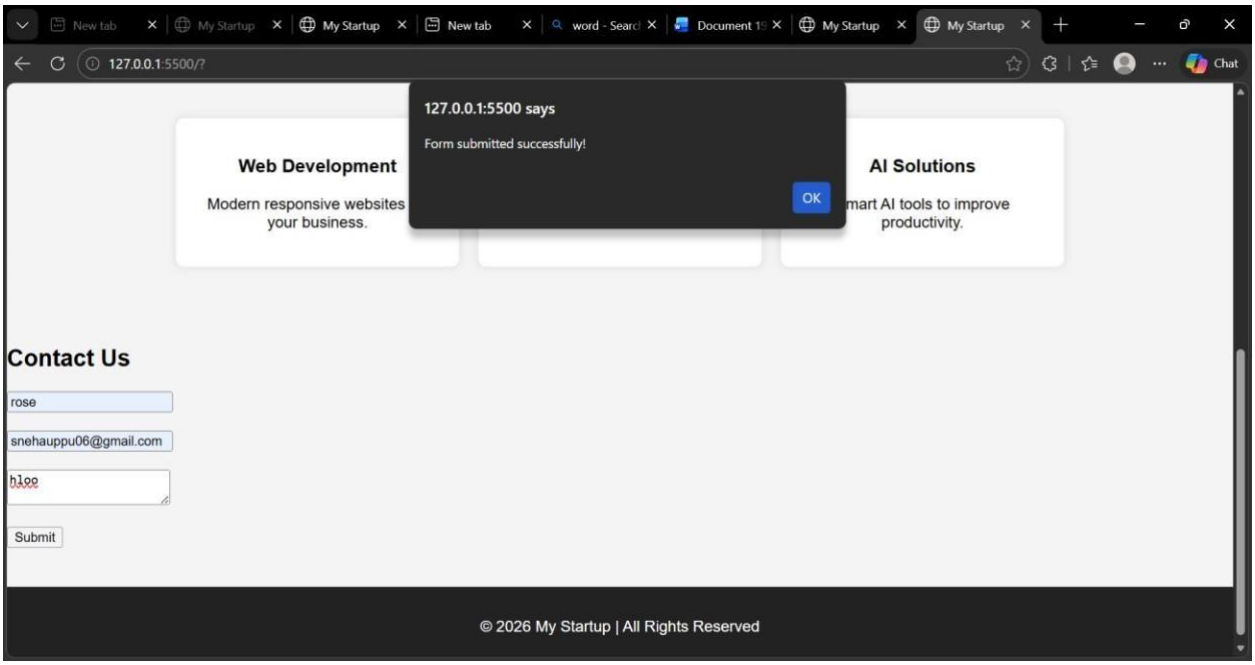


2)script.js – add below previous code:



lab14.4_project
index.html
style.css
script.js
script.js > validateForm
4 function validateForm(){
5
6 let name = document.getElementById("name").value;
7 let email = document.getElementById("email").val
8 let message = document.getElementById("message").
9
10 if(name=="" || email=="" || message==""){
11 alert("Please fill all fields");
12 return false;
13 }
14
15 alert("Form submitted successfully!");
16 return true;
17
18 }

Output:



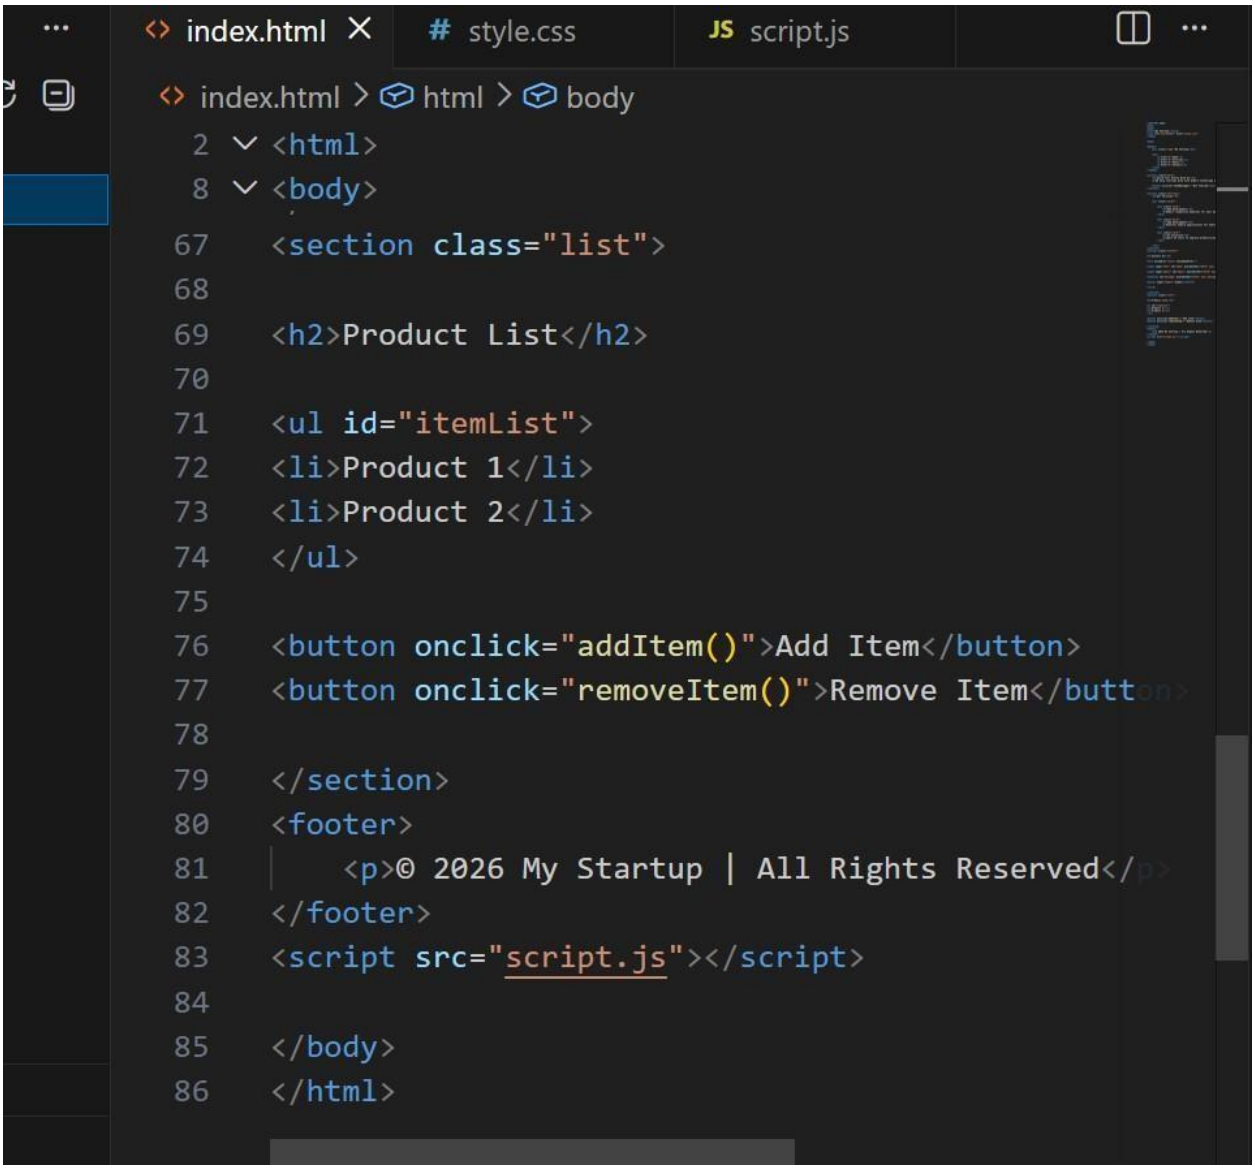
Expalantion:

This task creates a **contact form with Name, Email, and Message fields**.
JavaScript validation checks whether the fields are empty and displays an alert message before submitting the form.

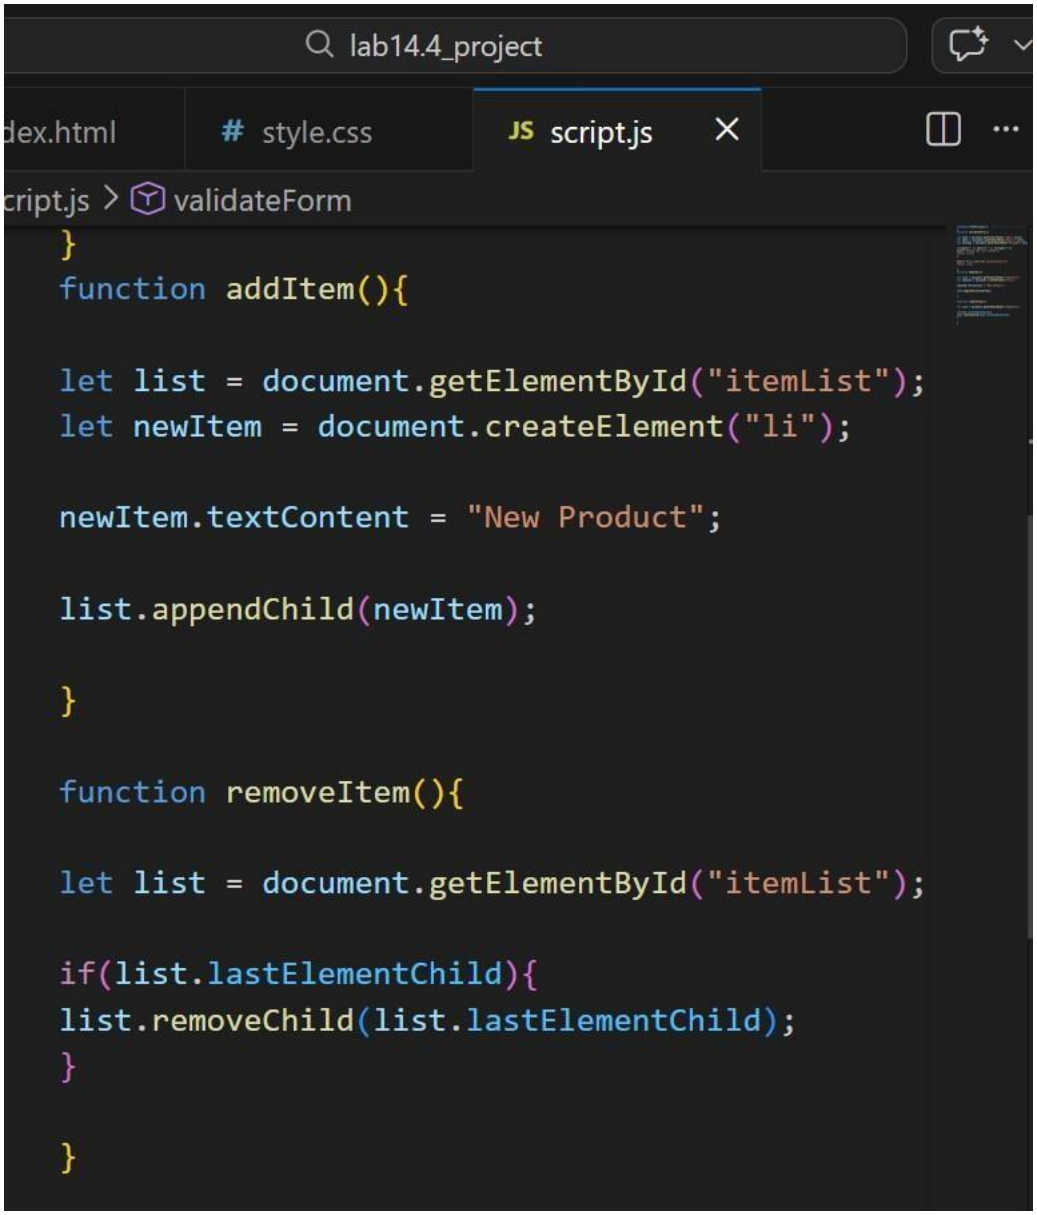
Task 4: Dynamic Product List using JavaScript

Prompt: Create a dynamic product list where users can **add new items and remove items** from the list using JavaScript buttons.

Code:

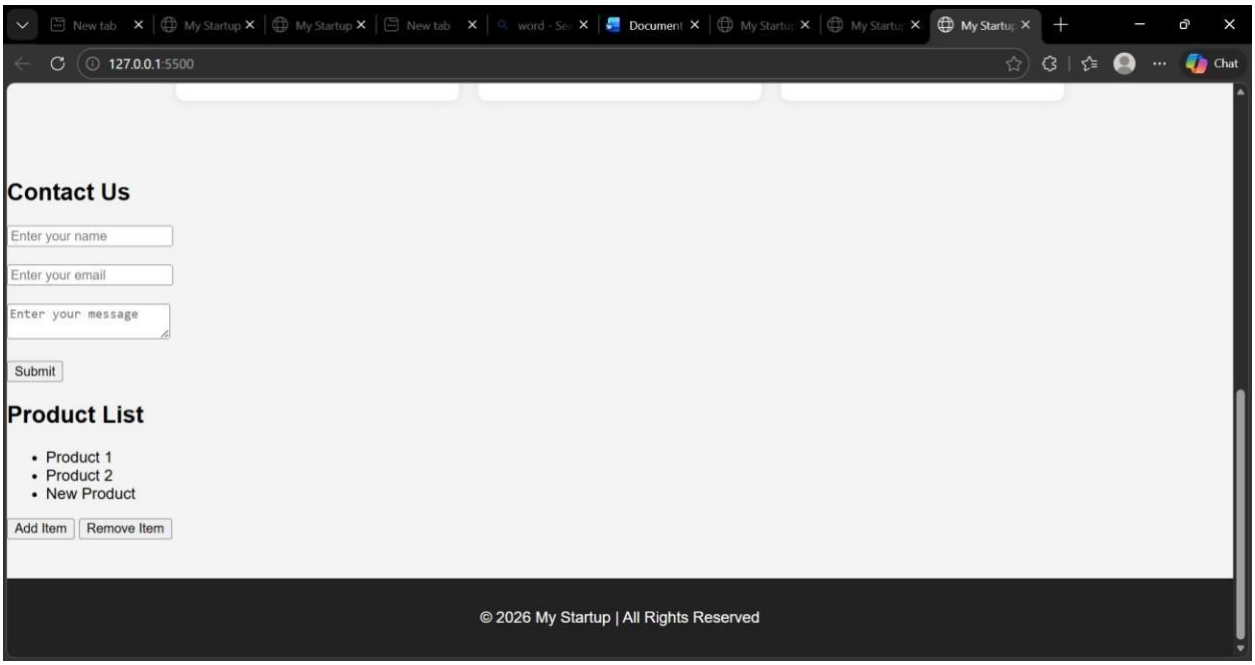


2)Java Script Add Item:



lab14.4_project
dex.html
style.css
script.js
cript.js > validateForm
}
function addItem(){
let list = document.getElementById("itemList");
let newItem = document.createElement("li");
newItem.textContent = "New Product";
list.appendChild(newItem);
}
function removeItem(){
let list = document.getElementById("itemList");
if(list.lastElementChild){
list.removeChild(list.lastElementChild);
}
}

Output:



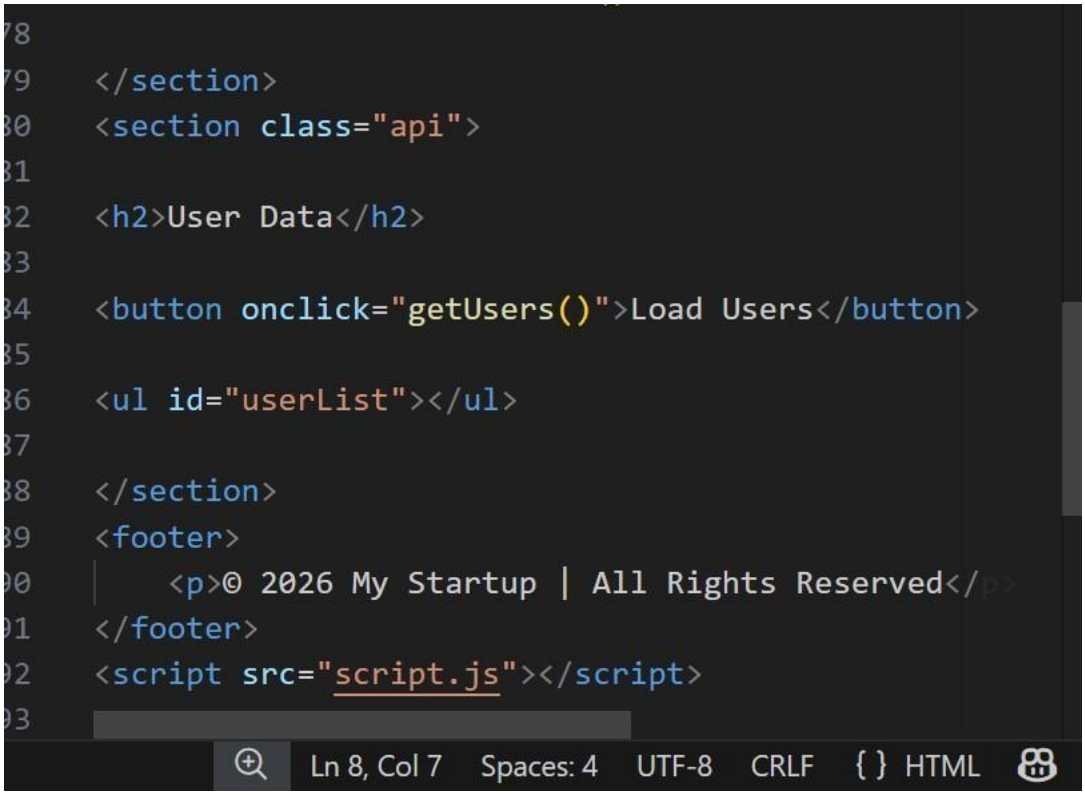
Explanation:

This program creates a dynamic product list where users can add or remove items using buttons. JavaScript DOM functions like `createElement()` and `appendChild()` are used to modify the list.

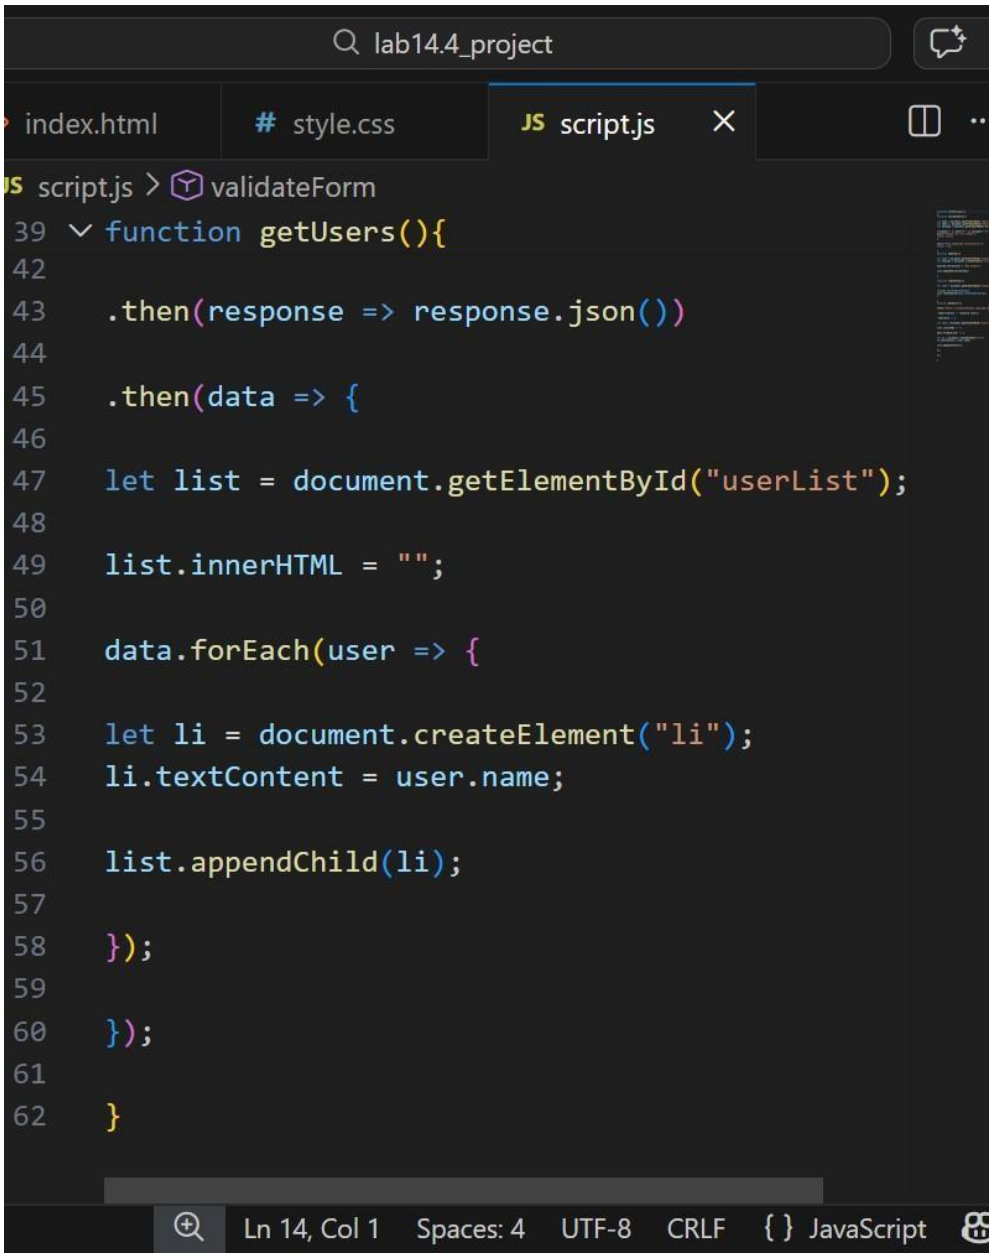
Task 5: Fetch Data using JavaScript API

Prompt: Create a webpage that **fetches data from an API using JavaScript Fetch API and displays it on the webpage dynamically**.

Codes: Index .Html

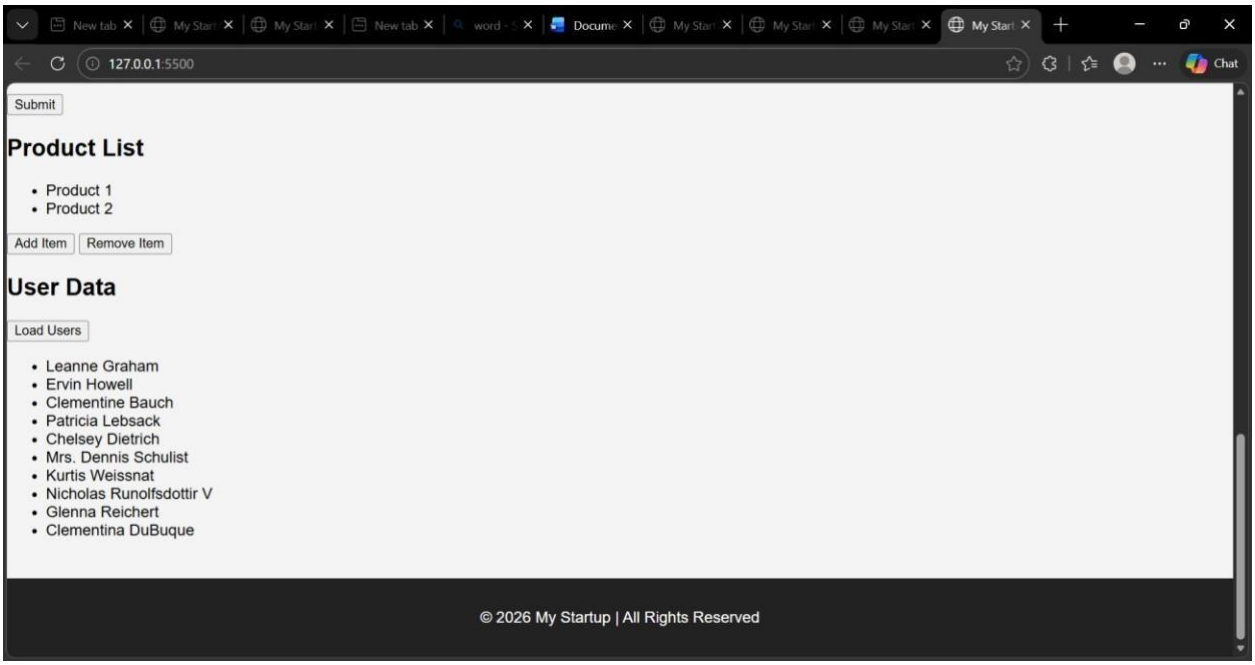


2)Java Script(Load Users):



lab14.4_project
index.html
style.css
script.js
script.js > validateForm
function getUsers(){
.then(response => response.json())
.then(data => {
let list = document.getElementById("userList");
list.innerHTML = "";
data.forEach(user => {
let li = document.createElement("li");
li.textContent = user.name;
list.appendChild(li);
});
});
}
Ln 14, Col 1
Spaces: 4
UTF-8
CRLF
{ } JavaScript

Output:



Explanation:

The Fetch API is used to retrieve user data from an external API. JavaScript dynamically creates list elements and displays the user names on the webpage. The JavaScript code processes this data and dynamically creates list elements to display the user names on the webpage. This allows the webpage to update content without reloading the page.
